

Top-off stored beam perturbation

Measured turn-by-turn oscillations of beam

- peak-to-peak/FWHM:
 - horizontal = 6
 - vertical = 100
 - IDs $\text{FWHM}_{x,y} = (1.0, 0.022)$ mm
- damping time: 5 msec
- repetition period
 - now: 100 msec
 - top-off: 10 minutes

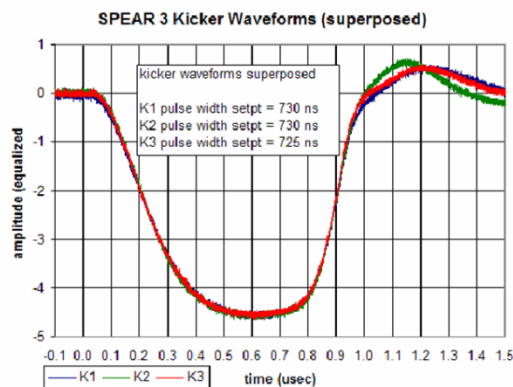

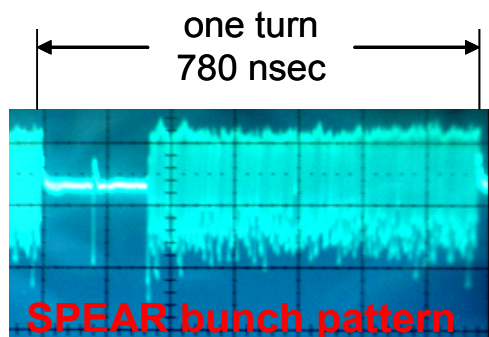

(Oscillations at $\beta_x = 3.5$ m, $\beta_y = 12.5$ m)

- Vertical transient from septum magnet leakage field corrected:

- Horizontal transient from injection kicker bump through sextupoles reduced by adjusting middle kicker pulse width:

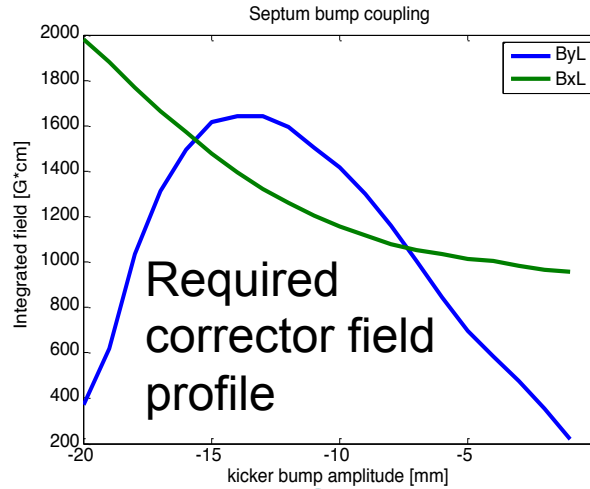

Stored beam kick vs. bump amplitude

5-pole magnet, cancels septum leakage fields

Measurements

+

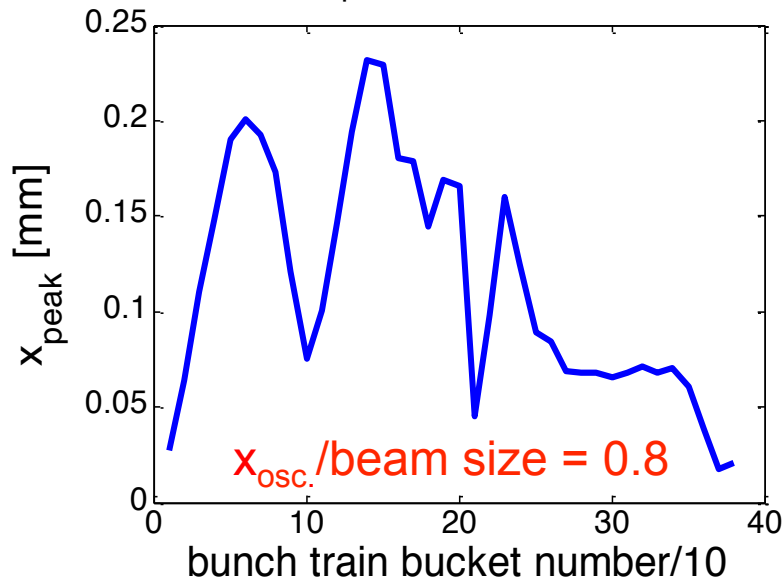

Beam-based injection bump matching

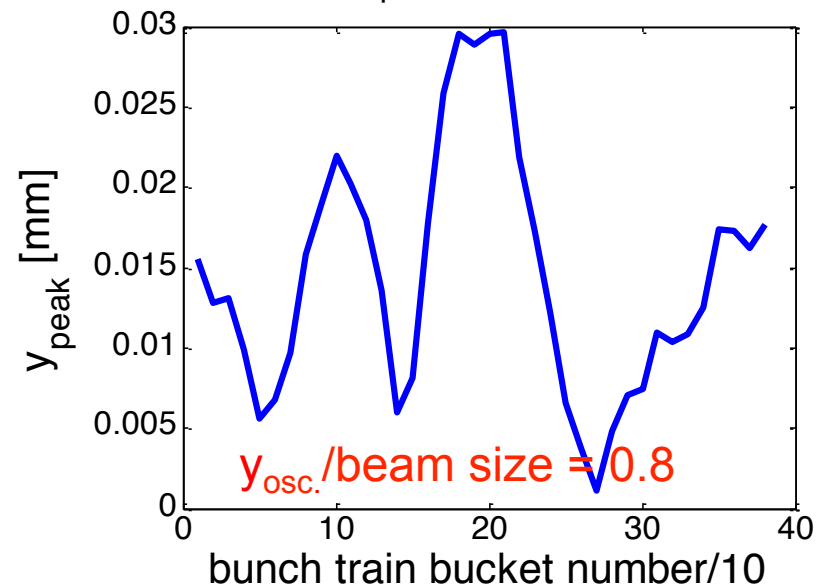

- Measure horizontal and vertical oscillations of stored beam as a function of bunch number kicked.
- Vary 2 kicker strengths, kicker timing, and kicker pulse widths to minimize x.
- Vary 2 skew quadrupoles plus septum 5-pole corrector to minimize y.

$\langle x_{\text{peak}} \rangle = 114 \text{ um}$

$\langle y_{\text{peak}} \rangle = 14 \text{ um}$

SPEAR injection kickers, first kicks

- Initial pulses narrower
- Increases stored beam kick
- Improvements under way
